

SHAIK MOHAMMAD ANEES

Azure Cloud & DevOps Engineer

✉ ansmd8374@gmail.com | ☎ 8374737656 | [LinkedIn](#)

SUMMARY

Azure Cloud & DevOps Engineer with hands-on experience designing and automating cloud infrastructure and application deployments on Microsoft Azure using Terraform, Docker, Kubernetes (AKS), Git, and CI/CD pipelines in Azure DevOps and GitHub Actions. Experienced in Infrastructure as Code, containerized workloads, deployment automation, and building repeatable, multi-tier cloud environments. Working knowledge of cloud security (Microsoft Entra ID / OIDC, secretless pipeline authentication), high availability, autoscaling, and monitoring and alerting with Prometheus and Grafana. Focused on reliable, secure, and cost-effective cloud solutions and SRE-oriented operational practices.

EDUCATIONAL QUALIFICATION

- B.Tech, Computer Science and Engineering — G. Pullaiah College of Engineering and Technology, Kurnool, AP — 75% — 2022–2025
- Diploma, Mechanical Engineering — BITS College, Kurnool, AP — 66.34% — 2017–2020
- SSC (10th) — Sri Lakshmi High School, Kurnool, AP — 85.5% — 2017

SKILLS

- **Cloud Platforms:** Microsoft Azure (AKS, App Service, Container Apps, ACR, Storage, Log Analytics, Entra ID, Resource Manager)
- **CI/CD & Version Control:** Git, GitHub Actions, Azure DevOps Pipelines (YAML), Azure Repos
- **Infrastructure as Code:** Terraform (HCL, remote state backend, plan/apply automation)
- **Containers & Orchestration:** Docker, Docker Compose, Kubernetes (AKS), Helm, Horizontal Pod Autoscaler
- **Monitoring:** Prometheus, Grafana, PromQL, ServiceMonitor, Azure Log Analytics, alerting
- **Scripting & Programming :** Python, Flask, PowerShell, YAML
- **Operating Systems:** Linux, Windows
- **Practices:** Infrastructure as Code, CI/CD automation, containerization, monitoring & observability, high availability & scalability, cloud security, cost optimization, troubleshooting, SRE practices

PROJECTS

Cloud Task Manager – Azure DevOps CI/CD Deployment

- Built a Python Flask web application and deployed it on Microsoft Azure App Service.
- Used Git and Azure Repos to manage source code and version changes.
- Automated the release path with an Azure DevOps YAML pipeline that installs dependencies, runs automated tests, packages the application, and deploys it to Azure on every commit.
- Configured an Azure Resource Manager service connection and Unicorn for secure, repeatable deployments and production-style application hosting.

Azure Infrastructure Automation – Terraform & Azure DevOps

- Provisioned Azure infrastructure as code with Terraform - Resource Groups, Storage Accounts, App Service Plans, and Linux Web Apps - making environments repeatable and version controlled.

- Configured Azure Storage as a remote Terraform backend for centralized, locked state management and safe collaborative changes.
- Created Azure DevOps pipelines to run Terraform format, validate, plan, and apply commands.
- Used Git and Azure Repos to manage Terraform code and configured a Service Connection for Azure access.

Containerized Cloud Application – Docker & Azure Container Apps

- Built separate Python Flask frontend and backend services and containerized them using Docker.
- Used Docker Compose and Docker networking to run and connect the services locally.
- Used Terraform to provision Azure Container Registry, Container Apps Environment, Log Analytics workspace, and Azure Container Apps, keeping the serverless container platform fully codified.
- Built and pushed Docker images to Azure Container Registry and deployed the frontend and backend as Azure Container Apps.

Kubernetes Observability & Auto-Scaling Platform on Azure

- Deployed a containerized Flask application on Azure Kubernetes Service (AKS) using Deployments, Services, readiness/liveness probes, resource requests and limits, and Helm charts to ensure availability and controlled resource usage.
- Implemented Prometheus and Grafana monitoring with ServiceMonitor, PromQL dashboards, and alerts for application traffic, CPU, memory, pod restarts, HTTP 5xx errors, and service availability.
- Configured and validated Horizontal Pod Autoscaler (HPA), demonstrating automatic scaling from 2 to 5 pods during CPU load and scaling back after the load stopped.
- Built a GitHub Actions CI/CD pipeline to build Docker images, push them to Azure Container Registry (ACR), and roll out updates to AKS using secretless Microsoft Entra OIDC authentication and kubelogin, removing long-lived credentials from the pipeline.

CERTIFICATES

Multi-cloud DevOps course — V cube Software Solutions — 2026

- Hands on training in Cloud, DevOps, CI/CD, Linux, Git, Docker, Kubernetes and GitHub Actions
- Practiced deploying and managing applications using Cloud and DevOps tools
